SECRET

SOME INSTRUCTIONS FOR USE OF THIS NOTEBOOK

This notebook is assigned to personnel performing research and development work and must be used for all original calculations, notes and abstracts from reports.

Assignee is responsible for the safeguarding of this notebook in accordance with security regulations.

This notebook must be returned to issuing office whem completed or upon termination of assignee.

Every page or entry should bear a date and the signature of the person who made the entry.

Entries should be made in ink whenever it is reasonable to do so.

Alteration or amplification of entries made on previous dates should be made as separate entries under their own dates and cross referenced to the previous entries.

Charts, drawings and graphs drawn on special paper should be glued or otherwise securely fastened in place and should individually bear a date and signature. Do not obscure any information.

The notebook should be periodically reviewed by one or more independent persons in the department and should be signed and dated by them. Likewise, they should make a statement that they have "read and understood the foregoing material." Witnessing stamps for this purpose are available in your department's office.

It is advisable to preface each new item, such as a heat treatment, process or reaction, etc., with a very brief description of the purpose, objective or approach.

Description of the invention or discovery should be complete enough to be understood by anyone skilled in the art.

Reference to name or catalogue number should be made when standard items are being discussed, i.e., Westinghouse pump.

In cases where work is conducted in cooperation with others, it is often necessary to meet with them from time to time and discuss new developments. The occurences of such conferences should always be entered in your notebook regardless of recording elsewhere, giving the date, who was present (if possible), and an outline of the subjects discussed. This often will establish error in occasional claims of other parties that you have appropriated information from them revealed during an interview, and thus provide you with patent protection.

½ power at 9:24:32 pm. (Log N reading at 1.1)
Scramed by photo-multiplier.
Something appears to be drastically changed from last foil exposure: at the scram, log N was reading 1.3 — a much lower value than our usual foil exposure level (2.0) but R-1 was reading 6.9 on 1000×1000 scale — approx. a factor of 2 over our usual foil exposure level. (3.9)
The photo-multiplier voltage was at the usual 900 volts.
The most plausible reason is that the five rods have made an entirely new reactor with very different leakage.

Red Light On by MB
Start-Up OK'd by DW Time 8:45 AM (PM) Date 12-8 1955.

Loading - "pure" 7½ loading - same as 15-1 without the extra full plates.

In position 37, the special fuel box has been inserted. This box is a water-tight container the same size as the fuel box. Eighteen S.S. plates in normal position are inside the box.

See note p. 4

The box contains 2,529.5 gm. of solution or ± 2 gm. of U^{235}. The rest of the boxes contain 7½ plate of fuel or 253 gms U^{235}.

Critical Conditions.

(1.) Water height 99.2 cm. Rod 29.01
Log N 0.062 Blade 0.01.

(2.) Rod inserted. Water taken up.
Water height 109.4 cm. Rod 15.25
Log N 0.205 Blade 0.015
DC-3 82.5 (10x20)
Temp. 72.5°F

Rod withdrawn to 29.02 Positive period measured

For a factor of 10, the period to 40 divisions.

40 × 21.72 = 869 sec

= 1.44 ¢

The blade from 20.91 to 0 is worth ~~23.9~~ 24.8 ¢
(from rod calibration curve)

∴ The total change in reactivity between runs 15-3 & 15.4 is ≈ 25.3 ¢

Note. Volume of solution in container was determined by three methods: weight loss of container: 2,529.5 ± 1 gm.
weight gain of element. 2525 ± 1 gm.
volume of material put in element. 2250 cc.
Using the average of the density measurements (pg 58) together with the volume measurement, the mass inserted [redacted] gm.

Note: Yesterday evening when we went to take the homogeneous box out of the core & found that it has been leaking solution. The contamination in the tank was very well localized to the box #24, the center plug, & the rubber cover over the dump valve. (See previous page)

Conditions — super critical.
blade in; rod in; water up

It is desirous to get the zero run condition with the blade near zero.

We are pulling, therefore, full plate 4-20 out of slot 8 of box 39 and re-inserting plate 5-39

12-13-55

To determine the amount of U solution lost from the liquid fuel element, its contents were removed and weighted.

3571 g. = wt of Red solution bottle (final)
1059 g. = tare wt. of bottle (some solution still in it)
2512 g = amount removed from liquid element

∴ 13 g short of original wt in element (p. 64)

Wt. of solution removed (in five steps: 470 cc, 452, 401, 446 and 393 = total of 2242 cc

∴ ~8 cc lost from water added of 2250 cc (p. 64)

(Cont. bottom p 72)

Critical Conditions:

Log N	.22	Control Blade	16.99
DC-3	50×50×10	Control Rod	29.02
Watertemp	72.5	Water Ht.	109.6

The effect of adding end boxes to the top of the assembly is that the core is slightly more reactive. Control Blade is lowered from 19.15 (exp 18-6) to 16.99 (18-7) or 3.35 ¢. This difference is negligiable when considered in term of Uranium Mass.

Clock Started at 5:51':28"

In order to approximate as closely as possible the run 20-9, the assembly was leveled at Log N = 1.6, since the clock was started at .74, $(2.0/e)$, the run will be accomplished 20 seconds earlier than the clock would indicate for a 20 minute run, thus keeping the time interval between the start of the run $Ln N = \frac{1.6}{e}$, and the period, 20 minutes. ~~30~~ 31 seconds being the period between $\frac{1.6}{e}$ and $\frac{2.0}{e}$

Critical Conditions.

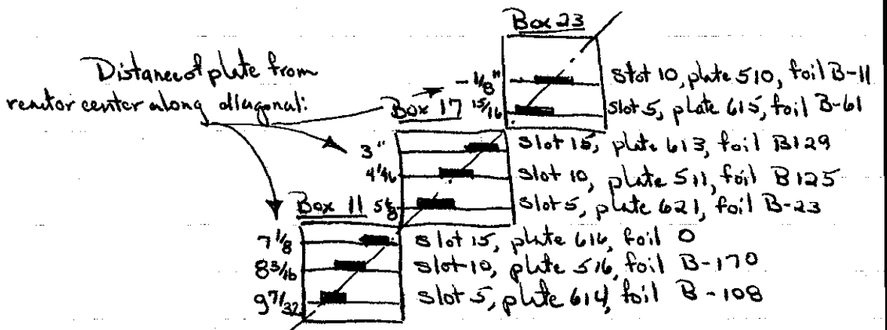
Start-Up OK'd by RJ Time 11:15 AM PM Date 1-4 1956

Loading - same as 20-10 except 515 has replaced 616 in slot 12, box 45

& 11-17 & 11-~~12~~ 21 now in boxes 36 & 10 slot 12 instead of S.S.

also the following foil plates have replaced the fuel originally in these slots:



Standardizing foil #20 in holder #1.

Note: reactor was very sub-critical on first trial. We then added fuel plates 11-17 & 11-12 & are making a second trial. The reason for the low reactivity of the core is not certain — the core was checked for possible plate vacancy but none was found. Log N got up to 0.1 on first trial but for a very short period of time.

ve power at: 12:01:27 a.m.

Run conditions —

Blade	9.14	Log N	2.0
Rod	29.02	DC-2	61 (10×10)
Water	109.3 cm.	R-1	6.6 (1000×1000)
		Temp	69°F

Expr. 19-7 Time 5:50 AM Date 1-5 1956
Purpose Zero check

Personnel:

INSTRUMENT CHECK

Date 1-5 1956 Time 5:50 AM Source No.

Instrument	Value	Scale	[illegible]	Start Up Scale
DC-1				
DC-2				
DC-3	✓ 80	10×20		
Log N	✓	12 sec.		
R-1	✓	.8×1000	1"	
R-2	4	×100		
P. M.	✓	800V	constant.	

Log N can now be check-calibrated every day by the following procedure — lay the γ-source on top of the core so that the source is touching the thimble housing the Log N chamber. In this position, log N should read 0.09.
